Appendix 2

Kernel maps the tagged harbour porpoises for each month divided into the Inner Danish Water and the Skagerrak/northern North Sea.
Appendix 3

Maps of the six acoustic surveys showing survey trackline and acoustic detection rate pr km. The underlying kernel density estimations is based on the satellite trackings from a two month period closest to the dates of survey. The sighting rate is given as a gradual scale where the size of the red points varies from 0.1 to 1 detection per km. Surveys were conducted on the following dates: 30 January – 2 February, 27-30 March, 29-31 May, 13-17 August, 1-4 October, 19-22 November 2007.
