

Particle Soot Absorption Photometer - PSAP

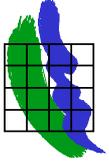

- simple and robust design (integrating plate), built at ITM
- 6 instruments installed in Stockholm and Copenhagen measuring at : regional, urban and kerbside locations
- MSc project: Peter Andersen (Supervision: Marianne, Matthias)
 - calibration experiment at ITM (Patricia, Gustavo, HC, Johan...)

Particle Soot Absorption Photometer - PSAP

Measured Signal / Conversion

$$\sigma_a = \ln \left[\frac{\left(\frac{S}{S_R} \right)_t}{\left(\frac{S}{S_R} \right)_{t+\Delta t}} \right] \cdot \left(\frac{A}{C_{\text{Filter}} \cdot Q \cdot \Delta t} \right)$$

σ_a : Absorption coefficient (m^{-1})

S: Detected signal (voltage)

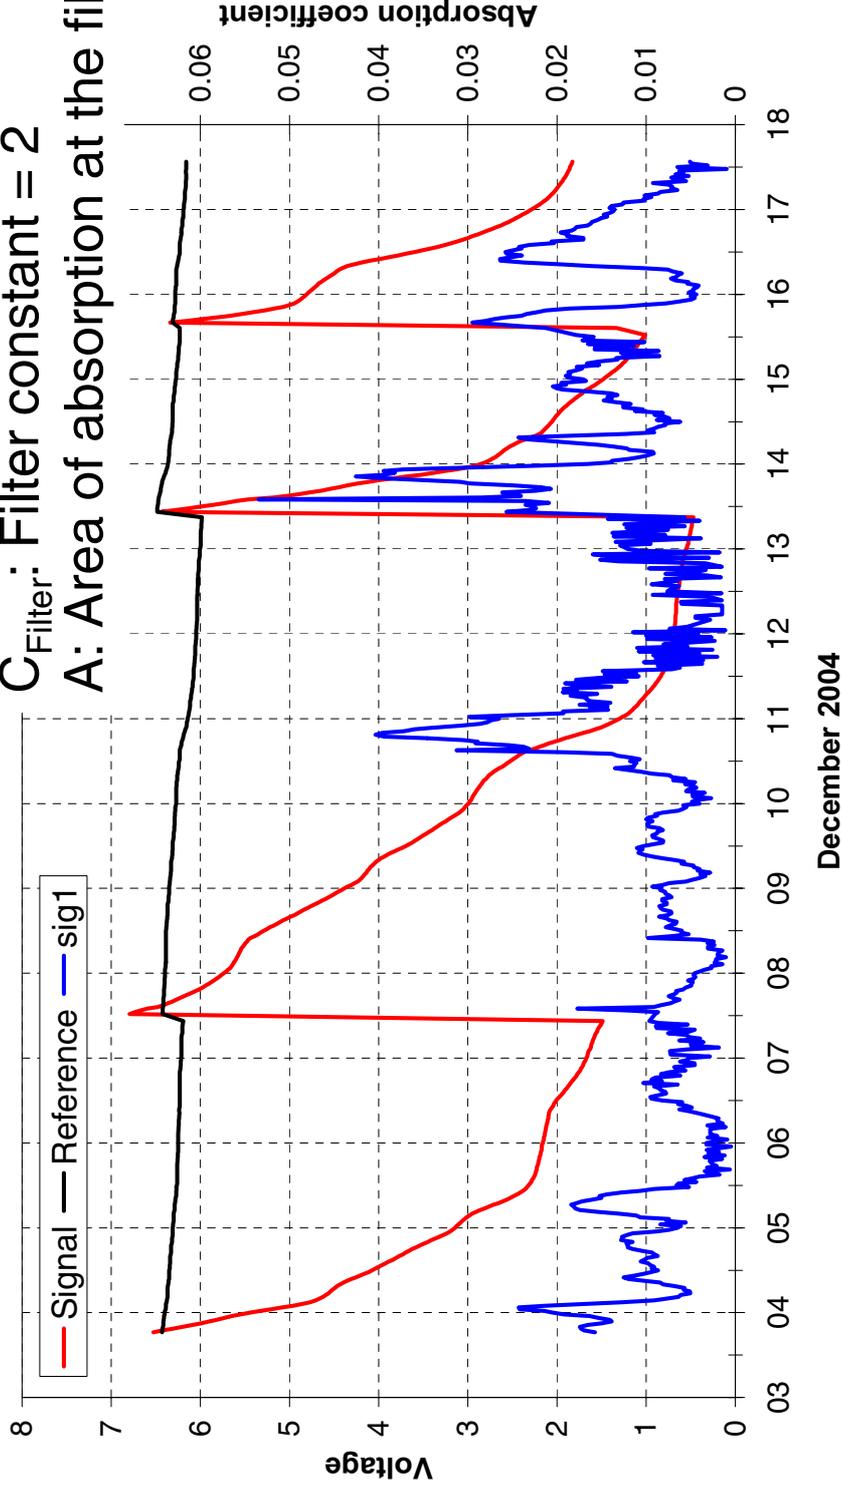

S_R : Detected reference signal (voltage)

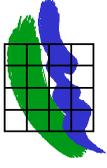

Q: Air flow through the filter (ml/min)

Δ_t : Time between the measuring points (min)

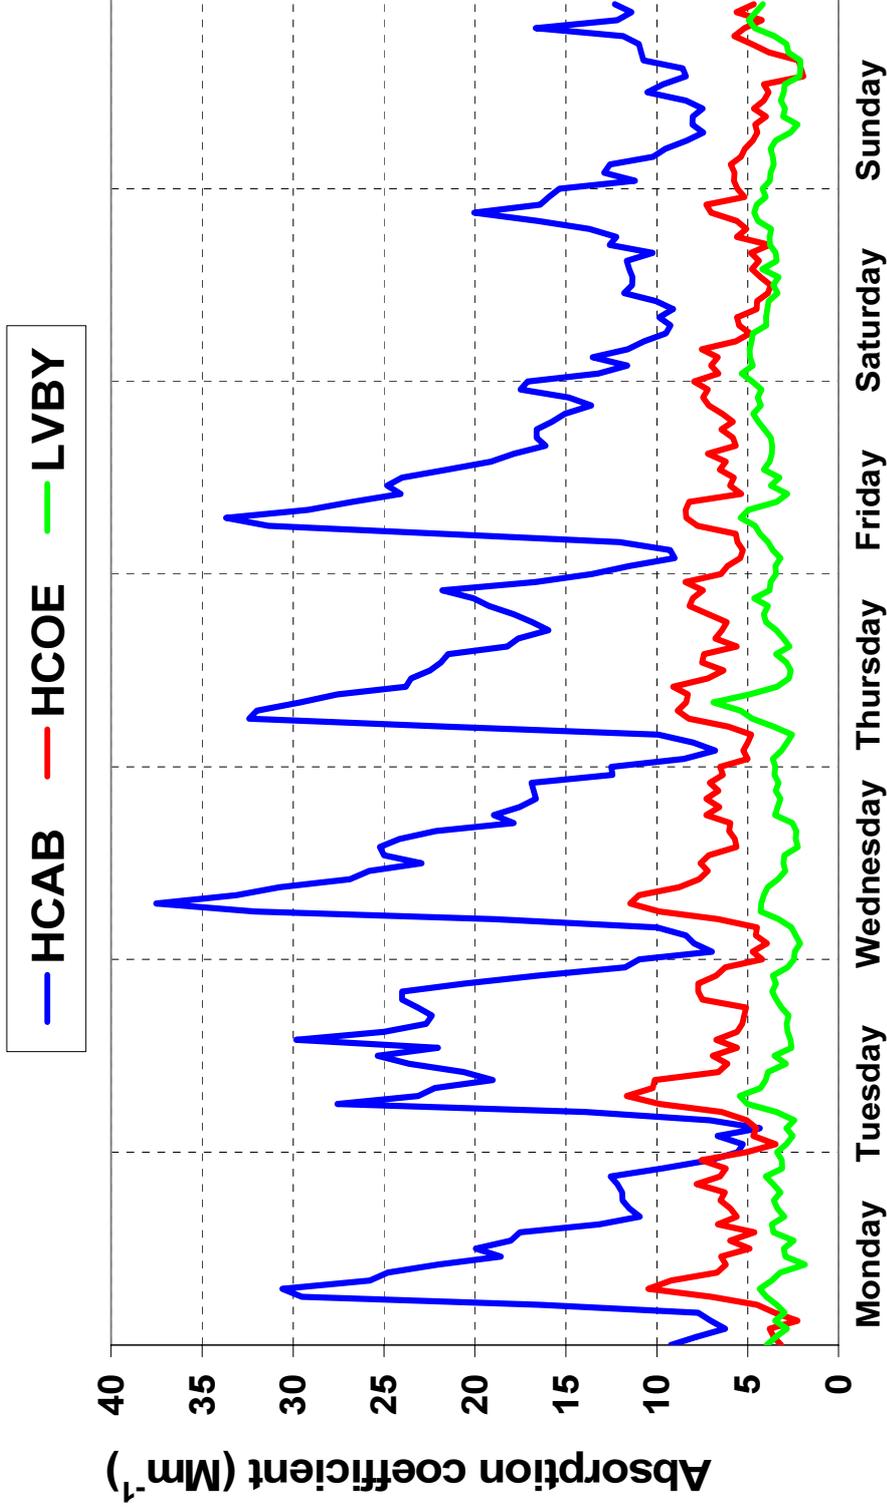

C_{Filter} : Filter constant = 2

A: Area of absorption at the filter (m^2)

Average week - Absorption coefficient

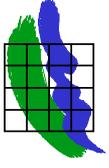

HCAB: H. C. Andersens Boulevard (Busy street in Copenhagen)

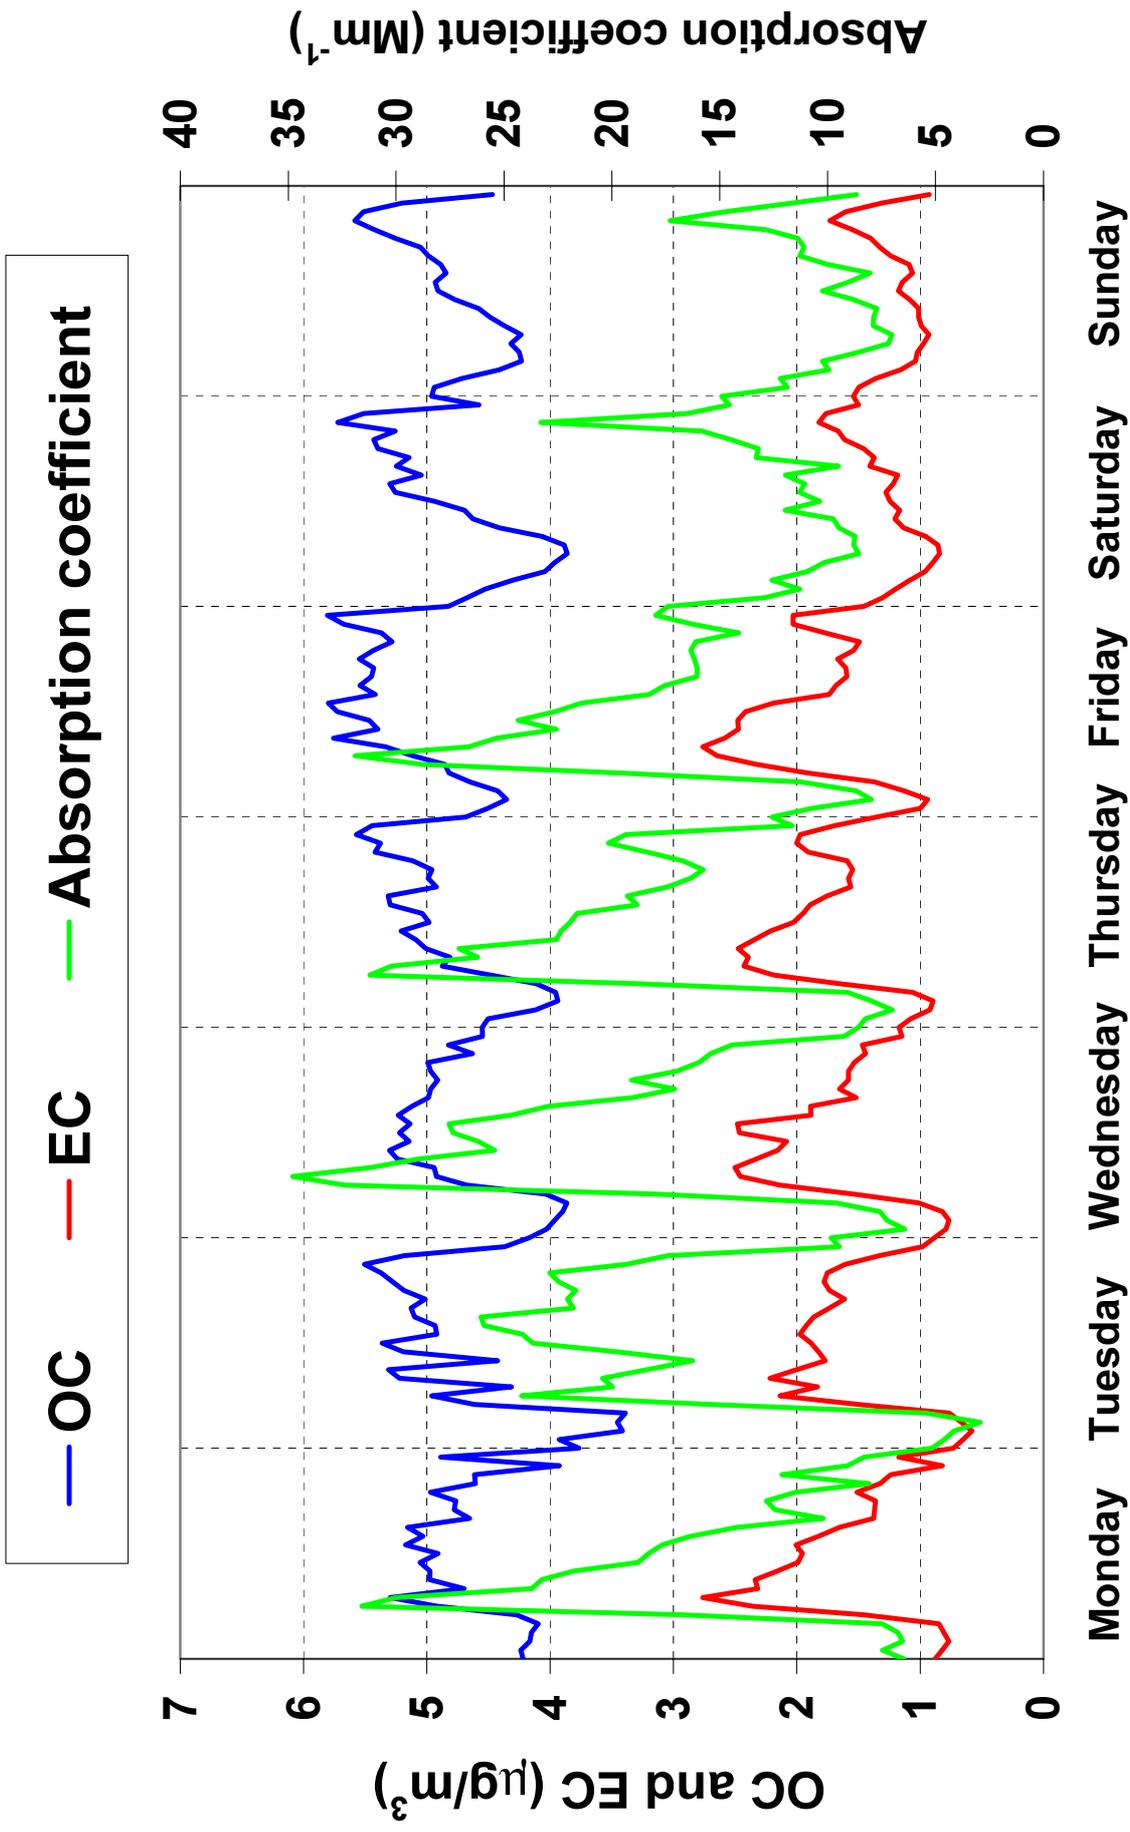

HCOE: H. C. Ørstedts Institute (Urban background in Copenhagen)

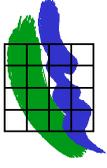

LVBY: Lilly Valby (Regional background)

Average
16 Mm⁻¹
6 Mm⁻¹
4 Mm⁻¹

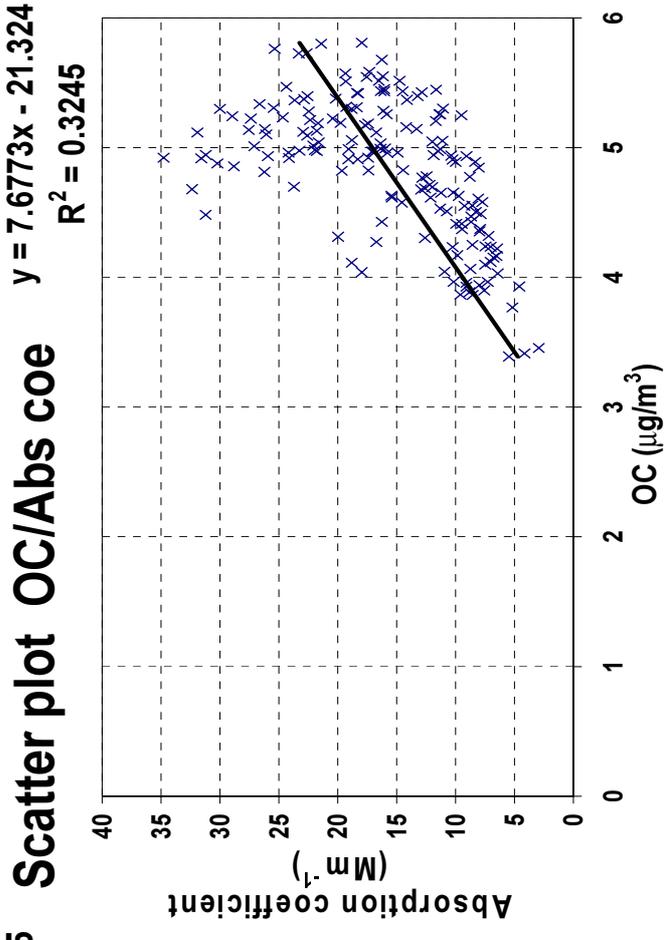

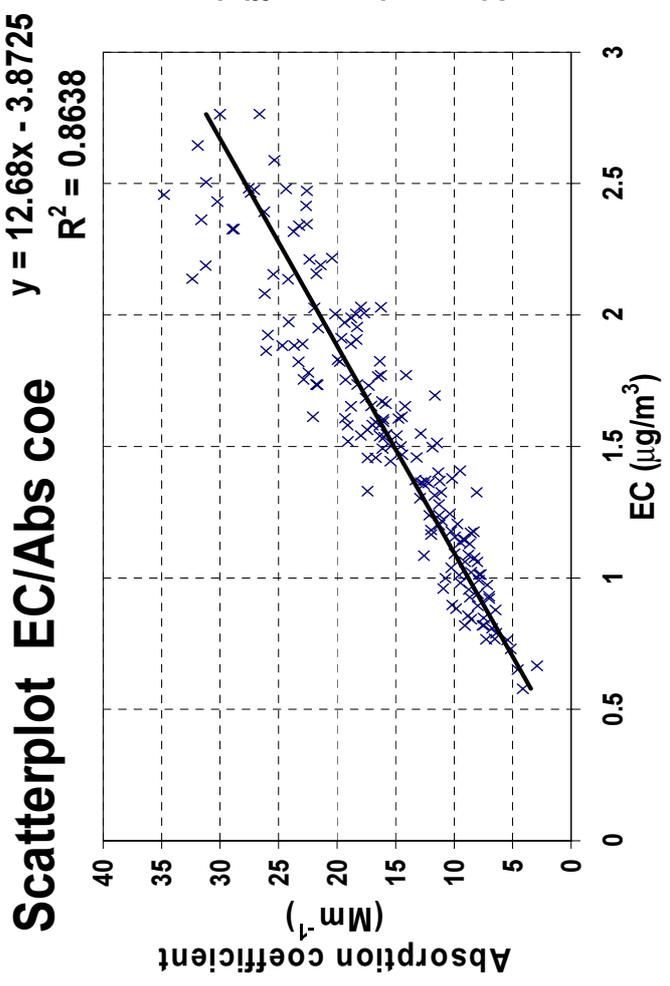

Comparison with ACPM at kerbside (HCAB)

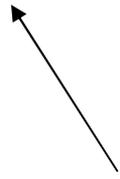

Comparison with ACPM at kerbside (HCAB)

$$EC (\mu g/m^3) = \frac{\text{Absorption Coefficient } (Mm^{-1}) + 3.8}{12.7}$$

$$C_{\text{Soot}} (g/m^3) = \frac{\sigma_a (m^{-1})}{\sigma_{\text{specific}} (m^2/g)}$$

In the literature found in the range 2 to 20
